

E-commerce Funnel & Customer Behavior Analysis

- Analyzed **50,000+ customer records** to study user behavior and conversion patterns in an e-commerce environment
- Designed a **behavioral funnel (Engagement → Intent → Conversion)** using Excel to identify user drop-offs
- Discovered a **67% drop-off between engagement and intent stage**, highlighting key conversion bottleneck
- Built an interactive **Power BI dashboard** to visualize funnel metrics, conversion rates, and churn insights
- Provided **data-driven recommendations** to improve user intent and reduce churn

Problem

I worked on analyzing an e-commerce dataset to understand where users drop off in their journey.

Approach

Since event-level data was not available, I created a behavioral funnel using metrics like session duration, pages viewed, and cart abandonment.

Analysis

I categorized users into engaged, intent, and converted segments and calculated conversion and drop-off rates.

Key Insight

I found a major drop-off of around 67% between engagement and intent stage.

Business Impact

This indicates that users are browsing but not showing purchase intent, so improving UX, offers, or product visibility can increase conversions.
